Height: 24 inches

Spread: 24 inches

Sunlight: ○ ◐

Hardiness Zone: 4

Description:

A small, slow growing evergreen shrub that is dense and compact, with bluish-green needles forming a tight mound; very adaptable and durable, a high quality garden plant; best in full sun

Ornamental Features

Granby Dwarf Limber Pine is a dwarf conifer which is primarily valued in the garden for its interestingly mounded form. It has attractive grayish green evergreen foliage. The needles are highly ornamental and remain grayish green throughout the winter.

Landscape Attributes

Granby Dwarf Limber Pine is a dense multi-stemmed evergreen shrub with a mounded form. Its relatively fine texture sets it apart from other landscape plants with less refined foliage.

This is a relatively low maintenance shrub. When pruning is necessary, it is recommended to only trim back the new growth of the current season, other than to remove any dieback. It has no significant negative characteristics.

Granby Dwarf Limber Pine is recommended for the following landscape applications;

- Accent
- Mass Planting
- General Garden Use

Planting & Growing

Granby Dwarf Limber Pine will grow to be about 24 inches tall at maturity, with a spread of 24 inches. It tends to fill out right to the ground and therefore doesn't necessarily require facer plants in front. It grows at a slow rate, and under ideal conditions can be expected to live to a ripe old age of 100 years or more; think of this as a heritage shrub for future generations!

This shrub does best in full sun to partial shade. It prefers dry to average moisture levels with very well-drained soil, and will often die in standing water. It is considered to be drought-tolerant, and thus makes an ideal choice for a low-water garden or xeriscape application. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. This is a selection of a native North American species.
